Service Portal Cloudeka

Cloudeka is a Cloud Computing platform that provides various cloud services including computing, storage, networking, and more. Cloudeka is supported by self-service through the dashboard service portal with features to configure, create projects, check billing, view and create rules in the organization. users can choose carefully from these services to develop new applications, or run existing applications on Cloudeka. Users can choose carefully the services to develop new applications, or to run existing applications on Cloudeka. There are two types of projects: **Prepaid** and **Postpaid**.

1. **Prepaid**

For the Prepaid type, it is used for personal needs that use personal email addresses and can only have one project so that the subscription period is relatively short without a letter of contract. For payment methods using **Virtual Account, LinkAja, OVO, Credit Card**.

At the beginning of registration, the deposit must be at least IDR 50,000.00. Make sure that the deposit is enough to be able to use a new service subscription, if the daily requirement used is above IDR.50,000,00, then at least the deposit content is as big as the daily requirement. This type is calculated using three methods: **PPU (Pay Per Use), Monthly, and One Time**.

2. **Postpaid**

The Postpaid type is used for companies and registers using the company's email address so that the subscription period is relatively long and there is a contract letter. For payment methods using **Virtual Account and Credit Card**.

Introduction

Deka Box is S3 Browser compatible storage objects spread across three data center locations with dedicated tenant portals to control buckets, access keys, and configuration. It is a cost-effective data store designed to handle large amounts of data with unlimited storage capacity.

Introduction

Deka CDN (Content Delivery Network) is one of the services from Service Portal Cloudeka which is used to increase the speed of accessing web pages while being accessed. Dekka CDN utilizes storage on Cloudeka so that fixed content such as images, text, videos, and web page visuals will be downloaded and stored on the nearest server storage so that the next time you access it, you don't need to download it again.

Guidance for Enterprise > Deka Claw

Introduction

Deka Claw is a feature within the platform designed to build, manage, and integrate AI-powered bots in a centralized environment. It provides a structured workflow for creating and managing bot instances, configuring AI providers, defining bot behavior through agents, and connecting bots to communication channels. Before using a bot, create a Deka Claw instance and complete the required configuration based on your use case. After the instance is created, you can access **GoClaw** to manage the bot environment or continue configuring the instance through the **Detail Deka Claw** page. To get started with Deka Claw, refer to the following guides:

- **Create Deka Claw** – Create a new Deka Claw instance and complete the required initial configuration.
- **Open GoClaw** – Access the GoClaw dashboard using the available access and login methods.
- **Provider** – Configure and manage AI providers used by the bot.
- **Agent** – Create and manage AI Agents that define bot behavior and AI model settings.
- **Channel** – Configure communication channels used by the bot, such as Telegram.

For detailed instructions, refer to the corresponding guide for each feature.

Introduction

Deka DNS is a feature for managing Domain Name System (DNS) configurations within **Service Portal Cloudeka**. It enables users to register and manage domains as DNS zones, providing the foundation for domain configuration and traffic routing. Each zone is displayed with a status that reflects its current configuration state within the platform.

Guidance for Enterprise > Deka LLM

Copy

Introduction

Deka LLM is one of the Service Portal Cloudeka that enables your business to utilize advanced AI models for generating and understanding text. This service simplifies access to high-level language models for tasks such as customer interactions, content creation, and analysis, without the need to manage the underlying infrastructure. If you already have access and have successfully logged into the Service Portal Cloudeka, select the LLM menu to navigate to the Deka LLM page.

The screenshot displays the Lintasarta Service Portal Cloudeka interface. On the left, a dark blue sidebar contains a menu with various service categories: Kubernetes, Deka Flexi, Deka Claw, LLM (highlighted with a red box), Box, DNS, SSL, CDN, Registry, Security, Ticket, Billing, and Balance. The main content area is titled 'Dashboard' and provides an overview of all projects. Below the dashboard, a 'Project List' section shows a table of projects. The first project, 'Demo Deka LLM', is highlighted. It is in an 'Active' state, created on '31 Mar 2026', and has a 'Postpaid' billing type. The project ID is '2fff1f6d-64af-46fe-97ef-115c7ab083f9'. The status cluster is 'Ready' and it was updated 8 hours ago. The user 'Technical Writer' (Useradmin) is logged in.

Project Name	Status	Created At	Billing Type	Project ID	Tags	Updated At
Demo Deka LLM	Active	31 Mar 2026	Postpaid	2fff1f6d-64af-46fe-97ef-115c7ab083f9	-	Updated 8 hours ago

To create Deka LLM in the Service Portal Cloudeka, you need to know the project type being used. You can learn more about the project type by checking [Check Project Type](#).

Endpoint Deka LLM

Currently Deka LLM has the following model categories:

1. LLM

Large Language Machine learning models, trained on large amounts of text data to understand and generate natural language. LLM has functions for various NLP (Natural Language Processing) tasks such as language translation, question answering, text completion, and several other things.

2. VLM

Visual Large Machine learning models, trained on large amounts of text data to understand and generate natural language. VLM has been used for tasks that require a combined understanding of images and text, such as describing an image, text-based image search, or answering questions based on images.

2. Embedding

Machine learning models that use numerical representations of objects, such as words, phrases, or images, in vector form in low-dimensional space. Embedding is used to capture the meaning or semantic features of the object. Embedding is used for models that require performing mathematical operations on non-numerical data, such as text or images.

Documentation

Introduction

The Deka Metal feature is part of the configuration settings in the Cloudeka portal that functions to manage resource usage limits (resource limitation) within projects integrated with the Deka Metal platform.

Through this feature, users can review and configure capacity limits for resources such as the number of clusters, nodes, namespaces, and storage used in a project.

This feature is available only for projects under Enterprise-type organizations with a Private environment — a dedicated environment with specific configurations and dedicated resources. When a user selects a project of this type, the system will display several additional menus that are available only in the Private Environment mode, one of which is Deka Metal.

Functionally, Deka Metal is used to manage resource usage limits for each account or project as defined by the Superadmin.

The Superadmin first sets the capacity limits at the organization level, and project users can then monitor or adjust their configurations according to the established limits.

with the organization's internal policies, helping to maintain performance and service stability within the private cloud environment.

Introduction

Deka Notebook is one of **Cloudeka** products owned by **Lintasarta**, designed with **GPU Acceleration** for data scientists, AI engineers, and researchers who require high-performance computing for deep learning and big data analytics. This managed service offers **plug-and-play GPU optimization**, reducing the time spent on setup and configuration.

Documentation

Guidance for Enterprise > Deka SSL

Introduction

Deka SSL (Secure Socket Layer) is a digital certificate that encrypts data transmitted between a website and its visitors, helping protect information from unauthorized access. When a website uses SSL, the HTTPS protocol and a lock icon appear in the browser, indicating that a secure connection has been established between the website and the browser.

The SSL menu provides security protocols that support privacy, authentication, and data integrity for internet communications. To create an SSL, Deka DNS must be created first. Refer to the guide on [Creating Deka DNS](#) for more information.

Guidance for Enterprise > Deka Vault GPU

Introduction

The Deka Vault GPU is used to create, manage, and restore data backups from resources available within a project. This feature helps ensure that data remains secure and can be recovered in the event of disruptions, configuration errors, or data loss.

Within the Deka Vault GPU menu, users can create backups manually or on a scheduled basis, specify the backup storage location, and perform data restoration as needed. Backup information such as backup name, cron time (schedule), retention period, and backup status can also be monitored on this page.

The Deka Vault GPU menu consists of several main tabs: Schedule, Backup, Location, and Restore, each of which is used to manage backup schedules, view the list of backups, define storage locations, and perform the data restoration process.

Guidance for Enterprise > Deka VPN GPU

Introduction

Deka VPN is a secure networking feature in Service Portal Cloudeka that creates a private and encrypted connection between your device and the Service Portal Cloudeka. With Deka VPN, you can safely access and manage cloud resources without exposing sensitive data to the public internet.

Deka VPN supports two protocols: IPSec and OpenVPN, giving you flexibility to choose the one that best fits your organization's needs. Both protocols are designed to keep your data safe and your connection reliable.

By using Deka VPN, your organization can build secure and scalable access to cloud environments, while ensuring compliance with security standards.

Guidance for Enterprise > Cloudeka API List

Copy

Introduction

The Cloudeka API List (**cldkctl**) is a Command Line Interface (CLI) tool that allows users to interact with Service Portal AI, a cloud service platform accessible through the Service Portal AI. It provides an efficient and consistent way to perform cloud operations directly from the terminal without relying on the web interface.

Through cldkctl, users can authenticate using a valid API token, view project and billing information, and manage various services such as compute instances, Kubernetes clusters, and large language model (LLM) workloads. The tool supports multiple operating systems — Windows, macOS, and Linux — enabling flexibility across different environments.

By using this CLI, users can automate tasks, securely manage infrastructure, and integrate Cloudeka services into their existing development or operational workflows. Overall, cldkctl offers a practical, secure, and unified method to streamline cloud management through command-line operations.
